

Review: **apply** functions so far

1. What is the main purpose of the **apply family** of functions in R?
2. In the function `apply(X, MARGIN, FUN)`, what does the argument `MARGIN` represent?
3. What is the difference between `lapply` and `sapply`?
4. What does the command `apply(foo, 1, sum)` compute if `foo` is a matrix?
5. What problem does `tapply` solve and how are subsets defined?
